Minimum Length Polygon

Definition

The *minimum length polygon* of C is a subset $P \in \mathbb{R}^2$ such that,

$$P = \underset{A \in \mathcal{A},\, \mathrm{IC}(C) \subseteq A,\ \partial A \subset \mathrm{OC}(C) \setminus \mathrm{IC}(C)^\circ}{\arg\min} \mathrm{Per}(A)$$

where $\mathcal{A}$ is the family of simply connected compact sets of $\mathbb{R}^2$.

Minimum Length Polygon

Reversible polygonal representation

Goal : represent a digital contour C using a polygon whose versices are centers of pixels either on the inner contour $\mathrm{IC}(C)$ or on the outer contour $\mathrm{OC}(C)$.

Reversible polygonal representation

Goal : represent a digital contour C using a polygon whose versices are centers of pixels either on the inner contour $\mathrm{IC}(C)$ or on the outer contour $\mathrm{OC}(C)$.

Definition

A *grid-vector* is a triplet $x = ((p,q),k,\delta) \in \mathbb{N}^2 \times \mathbb{N} \times \mathbb{B}$. where

- $\gcd(p,q) = 1$, q/p is the *slope* of x (with $1/0 = \infty$),
- $k \geq 1$ is its number of repetitions
- the boolean δ indicates if x has one endpoint on the inner contour and one on the outer.

Notation : $((p,q),k,\delta) = \begin{cases} (p,q)^k \text{ if } \delta \text{ is } \texttt{false}, \\ \widetilde{(p,q)}^k \text{ otherwise.} \end{cases}$

Reversible polygonal representation

Geometric interpretation of grid-vectors.

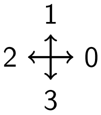
Definition

A *context* is an ordered pair of letters (a, b) among $\{(0,1),(1,2),(2,3),(3,0),(0,3),(3,2),(2,1),(1,0)\}$.

Given a context (a, b), a grid-vectors defines the following vector as follow :

$$\overset{(a,b)}{\overrightarrow{(p,q)^k}} = k(p\,\overrightarrow{a} + q\,\overrightarrow{b}),$$

$$\overset{(a,b)}{\overrightarrow{\widetilde{(p,q)}^k}} = k(p\,\overrightarrow{b} + q\,\overrightarrow{a}).$$



Reversible polygonal representation

Geometric interpretation of grid-vectors.

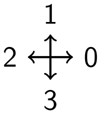
Definition

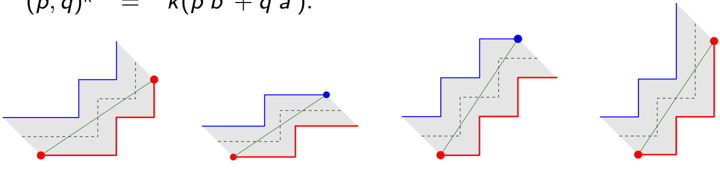
A *context* is an ordered pair of letters (a, b) among $\{(0,1),(1,2),(2,3),(3,0),(0,3),(3,2),(2,1),(1,0)\}$.

Given a context (a, b), a grid-vectors defines the following vector as follow :

$$\overrightarrow{(p,q)^k}^{(a,b)} = k(p\vec{a} + q\vec{b}),$$

$$\overrightarrow{\widetilde{(p,q)}^k}^{(a,b)} = k(p\vec{b} + q\vec{a}).$$



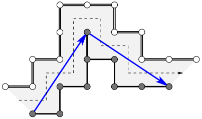


$(3,2)^1$ $\quad \widetilde{(2,3)}^1$ $\quad \widetilde{(3,2)}^1$ $\quad (3,2)^1$

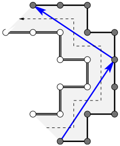
Reversible polygonal representation

- *Operators* : $\sigma^+(a,b) = (\overline{b}, a)$: a turn toward the interior,
  $\sigma^-(a,b) = (b, \overline{a})$: a turn toward the exterior,
  with the convention $\overline{0} = 2, \overline{1} = 3, \overline{2} = 0, \overline{3} = 1$.

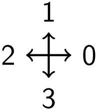
- *Grid-curve* : $\Gamma = [l_0, l_1, \ldots, l_{n-1}]$ where each l_i is either a grid-vector or one of the operators σ^-, σ^+.



$$[\underbrace{(2,3)}_{(0,1)}, \underbrace{\sigma^+}_{\substack{(0,1)\\ \downarrow \\ (3,0)}}, \underbrace{(2,3)}_{(3,0)}]$$



$$[\underbrace{(2,3)}_{(0,1)}, \underbrace{\sigma^-}_{\substack{(0,1)\\ \downarrow \\ (1,2)}}, \underbrace{(2,3)}_{(1,2)}]$$



Reversible polygonal representation

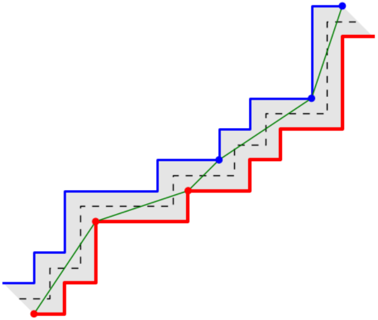
Notations :

- $\overset{(a,b)}{\overrightarrow{\sigma^-}} = \overset{(a,b)}{\overrightarrow{\sigma^+}} = (0,0)$.
- Let $x = ((p,q),k,\delta)$, $\quad x(a,b) = \begin{cases} (b,a) \text{ if } \delta \text{ is } \texttt{true}, \\ (a,b) \text{ otherwise.} \end{cases}$

Reversible polygonal representation

Notations :

- $\overset{(a,b)}{\overrightarrow{\sigma^-}} = \overset{(a,b)}{\overrightarrow{\sigma^+}} = (0,0)$.
- Let $x = ((p,q),k,\delta)$, $\quad x(a,b) = \begin{cases} (b,a) \text{ if } \delta \text{ is } \texttt{true}, \\ (a,b) \text{ otherwise.} \end{cases}$

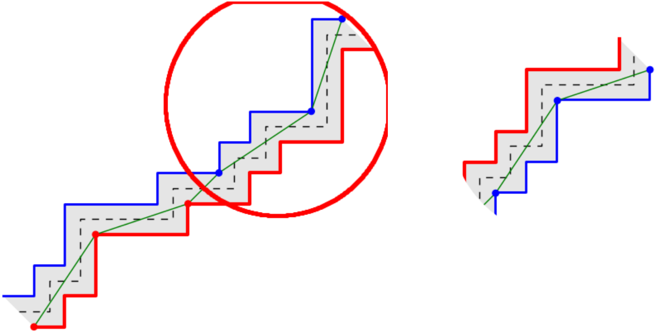


$[(2,3),(3,1),\widetilde{(1,1)},(2,3),(3,1)]$

Reversible polygonal representation

Notations :

- $\overset{(a,b)}{\overrightarrow{\sigma^-}} = \overset{(a,b)}{\overrightarrow{\sigma^+}} = (0,0)$.
- Let $x = ((p,q),k,\delta)$, $\quad x(a,b) = \begin{cases} (b,a) \text{ if } \delta \text{ is } \texttt{true}, \\ (a,b) \text{ otherwise.} \end{cases}$



$[(2,3),(3,1),\widetilde{(1,1)},(2,3),(3,1)]$

Reversible polygonal representation

Notations :

- $\overset{(a,b)}{\overrightarrow{\sigma^-}} = \overset{(a,b)}{\overrightarrow{\sigma^+}} = (0,0)$.
- Let $x = ((p,q),k,\delta)$, $\quad x(a,b) = \begin{cases} (b,a) \text{ if } \delta \text{ is } \texttt{true}, \\ (a,b) \text{ otherwise.} \end{cases}$

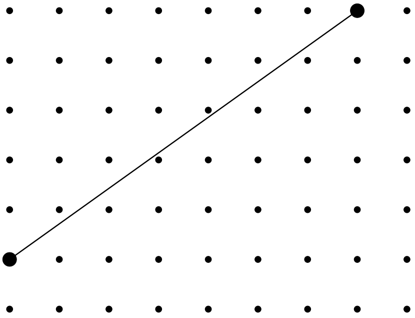
From grid-curves to polygons.
A grid-curve $\Gamma = [l_0, l_1, \dots, l_{n-1}]$, a context (a_0, b_0) and a start point P_0 define a polygonal curve $P_\Gamma = [P_0, P_1, \dots, P_n]$ as follow :

$$P_{i+1} = P_i + \overset{(a_i,b_i)}{\overrightarrow{l_i}} \quad \text{and} \quad (a_{i+1}, b_{i+1}) = l_i(a_i, b_i).$$

By fixing the first point on the inside or outside polygon, a discrete contour is defined unambiguously.

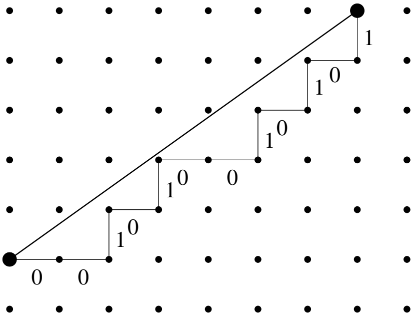
Reversible polygonal representation

Some words about Christoffel words.

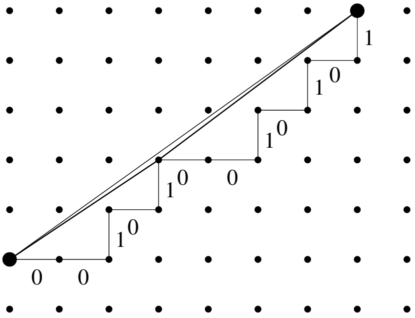


Reversible polygonal representation

Some words about Christoffel words.

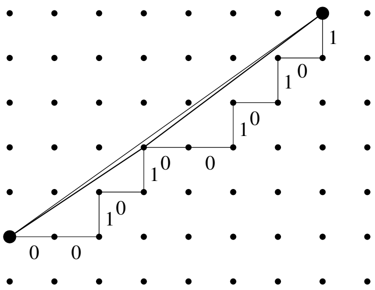


Some words about Christoffel words.



The *standard factorization* of a Christoffel word w is the only factorization $w = uv$ where u and v are both Christoffel words.

Reversible polygonal representation



$$\alpha = [z_0; z_1, z_2, \dots] = z_0 + \cfrac{1}{z_1 + \cfrac{1}{z_2 + \cfrac{1}{z_3 + \dots}}}$$

The Christoffel word c_n of slope $[z_0; z_1, z_2, \dots, z_n]$ is given recursively by :

$$c_n = \begin{cases} c_{2m-2} c_{2m-1}^{z_{2m}} & \text{if } n = 2m, \\ c_{2m}^{z_{2m+1}} c_{2m-1} & \text{if } n = 2m+1. \end{cases} \quad \text{where } c_{-1} = 2, \text{ and } c_{-2} = 1,$$

Reversible polygonal representation

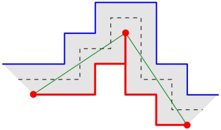
Let $\mathcal{C}_{q/p}^{(a,b)}$ be the Christoffel word of slope q/p over the alphabet (a, b).

A grid-curve $\Gamma = [l_0, l_1, \ldots, l_{n-1}]$ defines a digital contour by gluing all $F_{(a_i,b_i)}(l_i)$ defined as follow :

$$\begin{aligned} F_{(a,b)}\left((p,q)^k\right) &= \left(\mathcal{C}_{q/p}^{(a,b)}\right)^k, & F_{(a,b)}\left(\sigma^-\right) &= \overline{b}, \\ F_{(a,b)}\left(\widetilde{(p,q)^k}\right) &= a\overline{b}F_{(b,a)}\left((p,q)^k\right), & F_{(a,b)}\left(\sigma^+\right) &= a. \end{aligned}$$

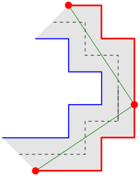
The interpixel path $F(\Gamma)$ is obtained from by removing *cancellations* that are factors of the form $a\bar{a}$.

Not unique



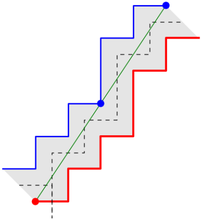
$\Gamma = [(3,2), \sigma^+, (3,2)],$

$$\begin{aligned} F_{(0,1)}(\Gamma) &= F_{(0,1)}\left((3,2)\right) \cdot F_{(0,1)}\left(\sigma^+\right) \cdot F_{(3,0)}\left((3,2)\right) \\ &= 00101 \cdot 0 \cdot 33030 \end{aligned}$$



$\Gamma = [(3,2), \sigma^-, (3,2)],$

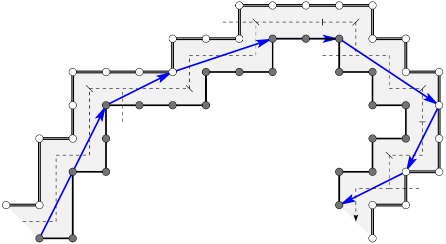
$$\begin{aligned} F_{(0,1)}(\Gamma) &= F_{(0,1)}\left((3,2)\right) \cdot F_{(0,1)}\left(\sigma^-\right) \cdot F_{(1,2)}\left((3,2)\right) \\ &= 00101 \cdot 3 \cdot 11212 \end{aligned}$$



$\Gamma = [\widetilde{(3,2)}, (3,2)],$

$$\begin{aligned} F_{(0,1)}(\Gamma) &= F_{(0,1)}\left(\widetilde{(3,2)}\right) \cdot F_{(1,0)}\left((3,2)\right) \\ &= 03 \cdot 11010 \cdot 11010 \end{aligned}$$

Reversible polygonal representation



$$
\begin{aligned}

\end{aligned}
$$

Definition

Two grid-curves Γ and Γ' are *equivalent*, if they define the same digital contour and ends in the same orientation.

The MLP of the digital contour C is the shortest grid-curve in the equivalence class defined by C.

Relative orientation of grid-segements

Notation

Given $x = ((p, q), k, \delta_x)$ and $y = ((r, s), l, \delta_y)$,

$$x \otimes y = \begin{cases} ps - qr & \text{if } \delta_y \text{ is } \texttt{false}, \\ pr - qs & \text{if } \delta_y \text{ is } \texttt{true}. \end{cases}$$

Three cases				
$x \otimes y = 0$	$x \otimes y < 0$		$x \otimes y > 0$	
				$[(3,2),(3,2)]$	$[(2,3),(2,1)]$	$[\widetilde{(1,3)},\widetilde{(2,3)}]$	$[(3,1),(2,3)]$	$[\widetilde{(3,2)},\widetilde{(2,1)}]$

Relative orientation of grid-segements

Notation

Given $x = ((p, q), k, \delta_x)$ and $y = ((r, s), l, \delta_y)$,

$$x \otimes y = \begin{cases} ps - qr & \text{if } \delta_y \text{ is } \texttt{false}, \\ pr - qs & \text{if } \delta_y \text{ is } \texttt{true}. \end{cases}$$

Three cases				
$x \otimes y = 0$	$x \otimes y < 0$		$x \otimes y > 0$	
				$[(3,2)^2]$	$[(2,3),(2,1)]$	$[\widetilde{(1,3)},\widetilde{(2,3)}]$	$[(3,1),(2,3)]$	$[\widetilde{(3,2)},\widetilde{(2,1)}]$

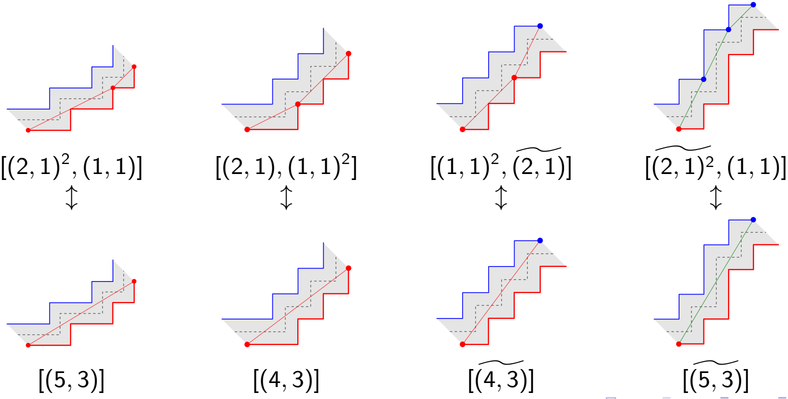
Merge case : $x \otimes y = 1$

Let $x = ((p, q), k, \delta_x)$ and $y = ((r, s), l, \delta_y)$ with

$$x \otimes y = 1, \qquad \begin{array}{c} \delta_y = \texttt{false} \text{ and } \min(k, l) = 1 \\ \text{or} \\ \delta_y = \texttt{true} \text{ and } l = 1 \end{array}$$

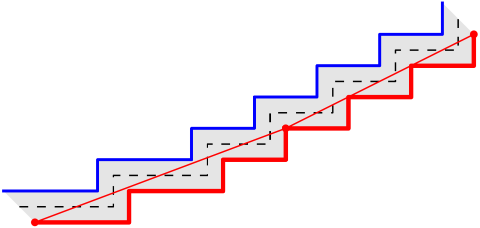
then

$$[x, y] \equiv [z] \text{ where } z = \begin{cases} ((kp + lr, kq + ls), 1, \delta_x) & \text{if } \delta_y = \texttt{false}. \\ ((kp + ls, kq + lr), 1, \neg\delta_x) & \text{otherwise.} \end{cases}$$



Split and merge case : $x \otimes y > 1$

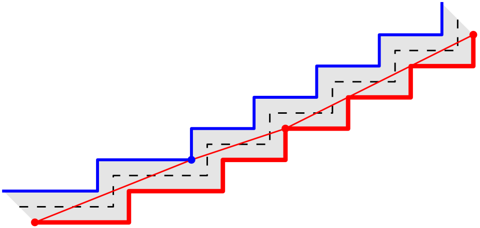
$(8, 3) \otimes (2, 1)^3 = 2.$



$[(8, 3), (2, 1)^3]$

Split and merge case : $x \otimes y > 1$

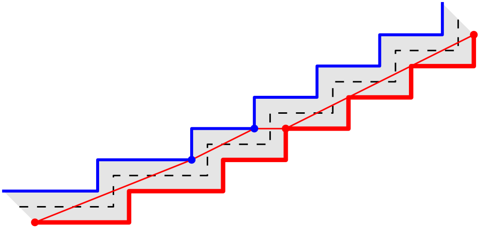
$$(8,3) \otimes (2,1)^3 = 2.$$



$$[(8,3),(2,1)^3] \equiv [\widetilde{(2,5)},\widetilde{(3,1)},(2,1)^3]$$

Split and merge case : $x \otimes y > 1$

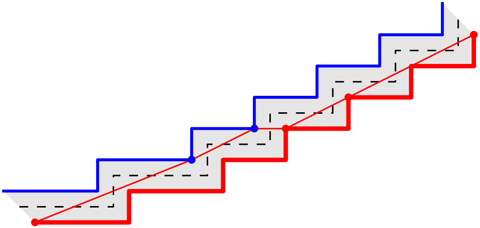
$(8,3) \otimes (2,1)^3 = 2.$



$$[(8,3),(2,1)^3] \equiv [\overbrace{(2,5)},(1,2),\overbrace{(1,0)},(2,1)^3]$$

Split and merge case : $x \otimes y > 1$

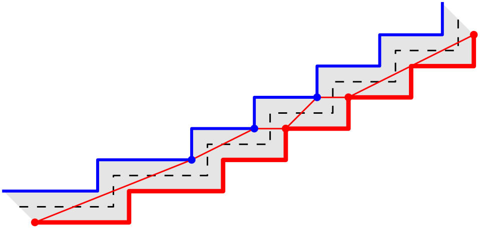
$(8,3) \otimes (2,1)^3 = 2.$



$[(8,3),(2,1)^3] \equiv [\widetilde{(2,5),}(1,2),\widetilde{(1,0),}(2,1),(2,1)^2]$

Split and merge case : $x \otimes y > 1$

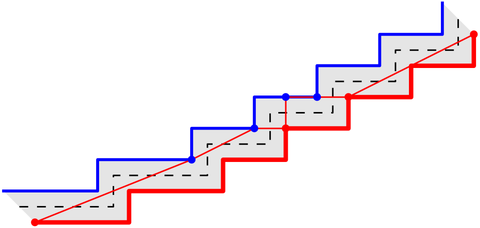
$(8,3) \otimes (2,1)^3 = 2.$



$[(8,3),(2,1)^3] \equiv [\widetilde{(2,5)},(1,2),\widetilde{(1,0)},\widetilde{(1,1)},\widetilde{(1,0)},(2,1)^2]$

Split and merge case : $x \otimes y > 1$

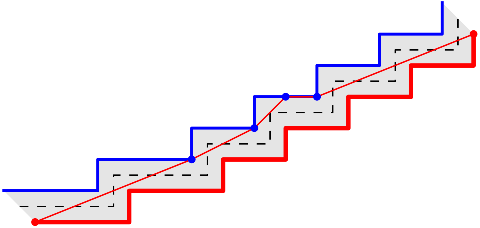
$(8,3) \otimes (2,1)^3 = 2.$



$$[(8,3),(2,1)^3] \quad \equiv [\widetilde{(2,5)},(1,2),\widetilde{(1,0)},\widetilde{(1,0)},(0,1),\widetilde{(1,0)},(2,1)^2]$$

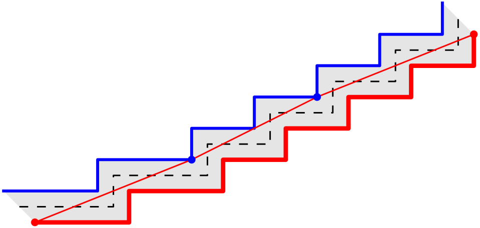
Split and merge case : $x \otimes y > 1$

$$(8,3) \otimes (2,1)^3 = 2.$$



$$[(8,3),(2,1)^3] \quad \equiv [\widetilde{(2,5)},(1,2),(1,1)(0,1),\widetilde{(5,2)}]$$

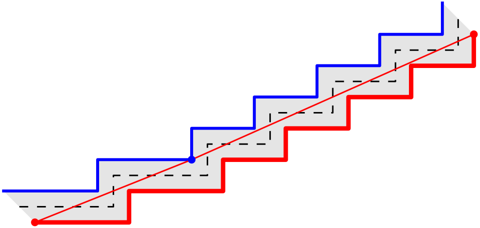
$(8,3) \otimes (2,1)^3 = 2.$



$[(8,3),(2,1)^3] \quad \equiv [\widetilde{(2,5)},(1,2)^2,\widetilde{(5,2)}]$

Split and merge case : $x \otimes y > 1$

$(8, 3) \otimes (2, 1)^3 = 2.$



$[(8, 3), (2, 1)^3] \quad \equiv [\widetilde{(2, 5)}, \widetilde{(9, 4)}]$

How to split ?

Notation

Let $x = ((p, q), 1, \texttt{false})$ and $q/p = [u_0; u_1, \ldots, u_n]$.

- $q_i/p_i = [u_0; u_1, \ldots, u_i]$,
- $x_i = ((p_i, q_i), 1, \texttt{false})$,
- $x_{-1} = ((0, 1), 1, \texttt{false})$,
- $x_{-2} = ((1, 0), 1, \texttt{false})$.

Definition

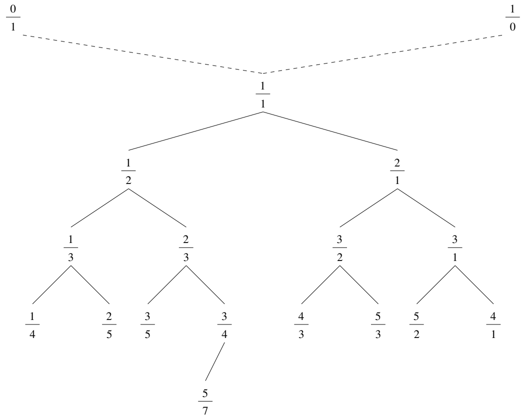
The *basic splitting* of the grid-vector x_n is the grid-curve :

$$s(x_n) = \begin{cases} [x_{2m-2}, x_{2m-1}^{u_{2m}}] \text{ if n = 2m,} \\ [x_{2m}^{u_{2m+1}}, x_{2m-1}] \text{ if n = 2m+1,} \end{cases}$$

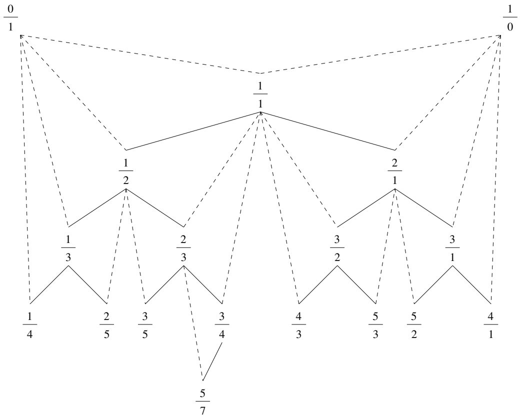
A grid-vector and it's basic splittings both define the same interpixel path.

$$s(x) = [y, z] \implies y \otimes z = 1.$$

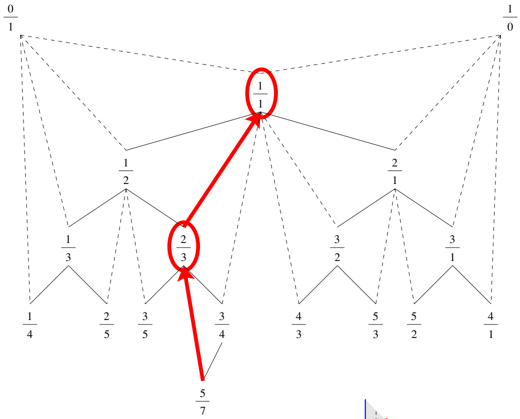
How to split ?



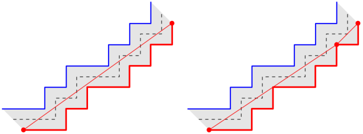
How to split ?



How to split ?

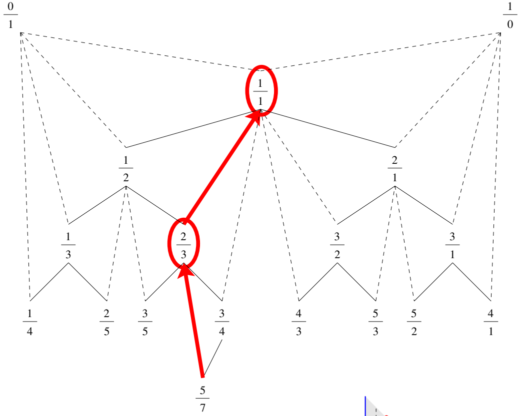


$5/7 = [0; 1, 2, 2]$,
$2/3 = [0; 1, 2]$,
$1/1 = [0; 1]$

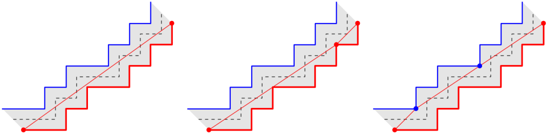


$$[(7, 5)] \equiv [(3, 2)^2, (1, 1)]$$

How to split ?



$5/7 = [0; 1, 2, 2],$
$2/3 = [0; 1, 2],$
$1/1 = [0; 1]$



$$[(7,5)] \equiv [(3,2)^2, (1,1)] \equiv [\widetilde{(1,1)}, (2,3), \widetilde{(3,2)}]$$

How to simplify σ^- ?

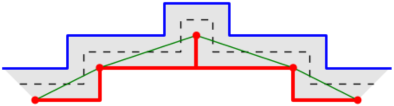
- Cancellation : $[\sigma^-,\sigma^+] \equiv [\sigma^+,\sigma^-] \equiv [\,]$

Flip a pixel on a flat part



$$[(2,1),(1,0)^3,\quad \underbrace{\sigma^-,(1,0),\sigma^+,\sigma^+,(1,0),\sigma^-,}_{\text{bumb}}\quad (1,0)^3,\sigma^+,(1,2)]$$

How to simplify σ^- ?

- Cancellation : $[\sigma^-,\sigma^+] \equiv [\sigma^+,\sigma^-] \equiv [\,]$
- Split the grid-edges in order to have a local part build only with $\{\sigma^+,\sigma^-,(1,0),(0,1),\widetilde{(1,0)},\widetilde{(0,1)}\}$. Operators σ^- are then simplify using local rules such as :

$$[(1,0),\sigma^-,(1,0),\sigma^+] \equiv [(1,1)] \text{ and } [\sigma^-,(1,0)^k,\sigma^+] \equiv [(0,1)^k]$$

Main result

Proposition

A grid-curve defining a digital contour may be simplified to a MLP using local rules.

Main result

Proposition

A grid-curve defining a digital contour may be simplified to a MLP using local rules.

Proposition

Given a grid-curve that is the MLP of a digital contour, this contour may be modified by adding or removing one pixel and its MLP updated in time sub-linear with respect to the length of the modified part of the MLP.
